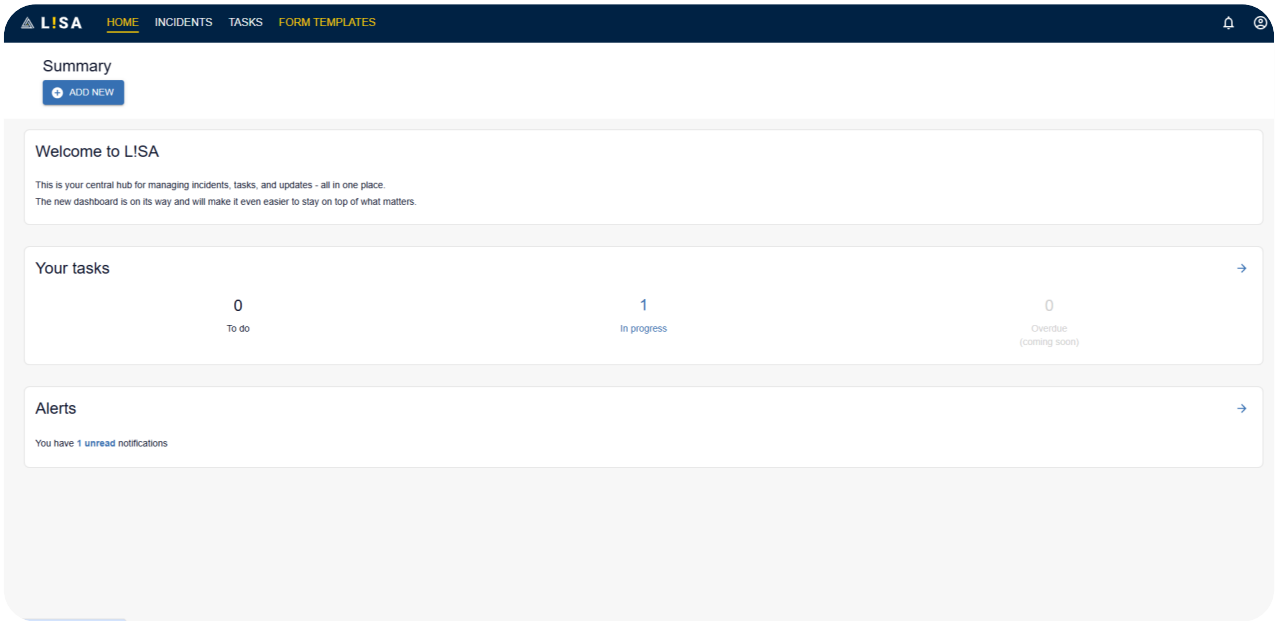
LISA - Admin User Guide: Adding Incidents, Managing Users, and Creating Custom Forms

Powered by guidde

This guide is designed for LISA users with administrative permissions, such as members of a local resilience forum. While these features are accessible on mobile, they are optimised for the LISA desktop interface to support complex data entry. The guide covers accessing admin controls, adding new incidents, managing users, and creating custom form templates.

01 Verifying Admin Permissions

Verify admin permissions by logging into LISA using a desktop browser from the NDTP landing page. Confirm that the Form Templates tab is visible in the main menu.



02 Navigating to Admin Settings

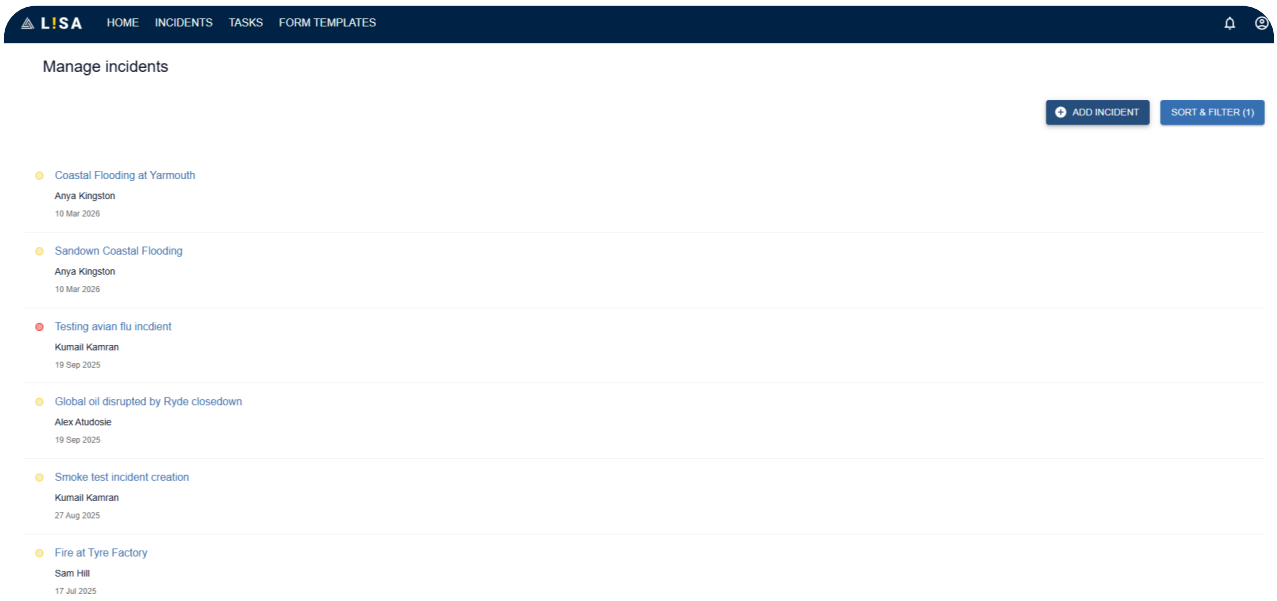
Access admin settings by clicking the profile icon in the top right corner of the home screen, and selecting settings.

For an admin user, the list will display the options 'Manage Users' and 'Manage Incidents'.

03 Adding New Incident Steps

To add a new incident:

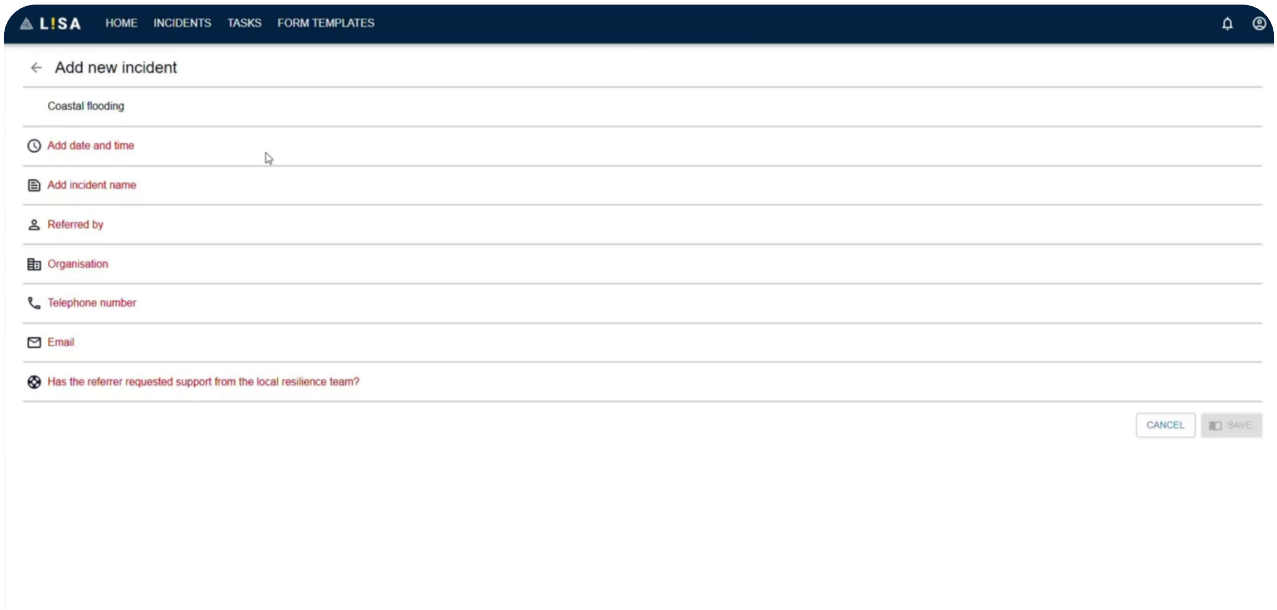
- Navigate to Settings and select Manage Incidents.
- Click the Add Incident button on the top right hand side of the page.



04 Incident Detail Entry and Publishing

All fields on this form are mandatory.

- Select an incident type from the drop-down list.
- Add the date and time, the incident name, the name of the person who referred the incident, their organisation, telephone number, and email address.
- Confirm whether support was requested from the local resilience team and provide details if required.
- Click Save to make the incident live and visible on the standard incidents page, allowing LISA users to begin logging activity against it.



05 Managing Users Overview

To oversee all personnel registered in LISA, navigate to the Settings page through the profile icon and select Manage Users.

- This page displays a list of all users registered in LISA.
- Use the Sort and Filter button to search for specific users or change the order of the list.
- Select a user to view their details and contact information.

In the current version of LISA, functionality for editing or deleting users is still under development. In future releases, the Add New User button will allow administrators to send formal invitations to join the application via email.

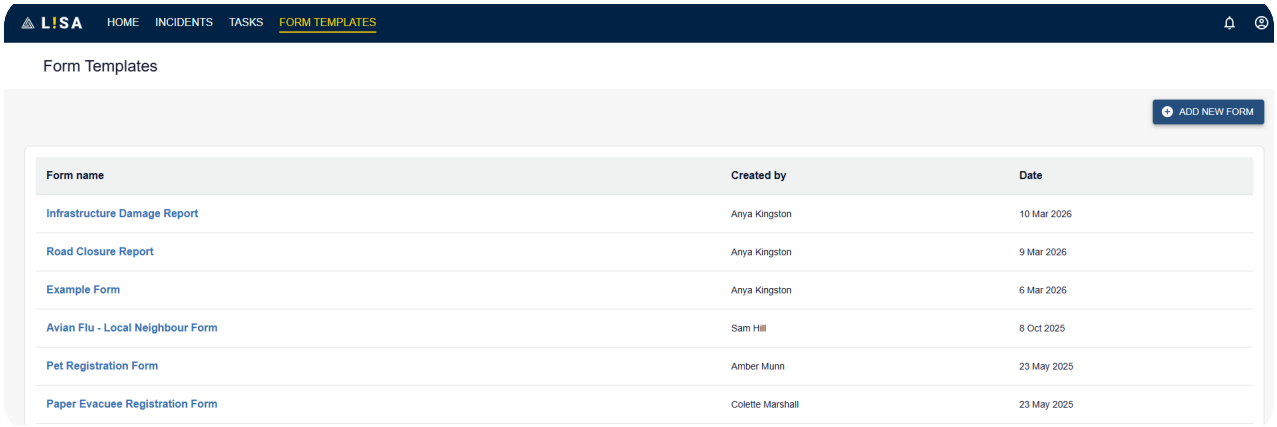
06 Adding New Custom Forms

Users with administrative permissions can also add custom forms. Custom forms allow users to capture structured data during incidents that is not covered by the standard LISA templates.

To access the form builder on a desktop device, click the Form Templates tab located in the main menu at the top of the screen.

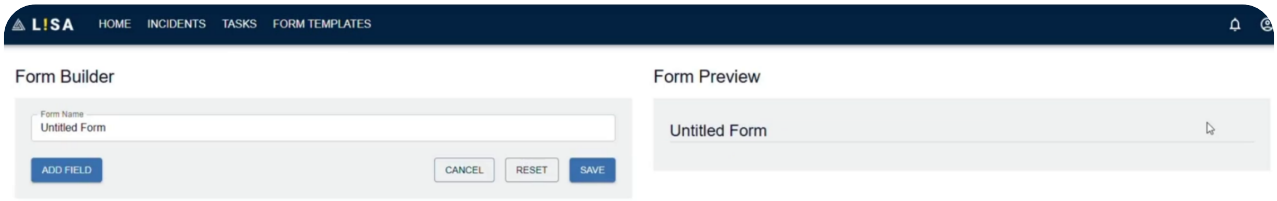
This page displays the list of forms currently available in LISA.

To add a new form, click the Add New Form button in the top right-hand side of the screen.



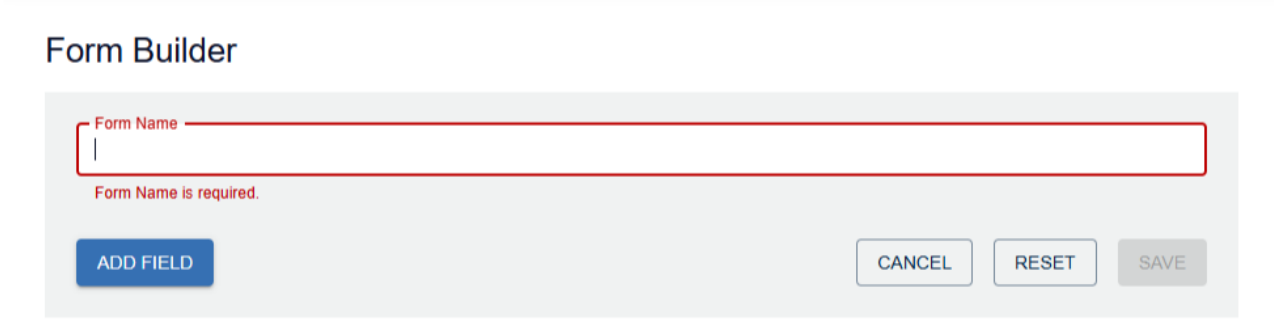
07 Form Builder Interface

The form creation screen is split into two sections. The form builder appears on the left and is used to add fields. The form preview appears on the right and shows how the form will appear to users.



08 Completing Form Fields

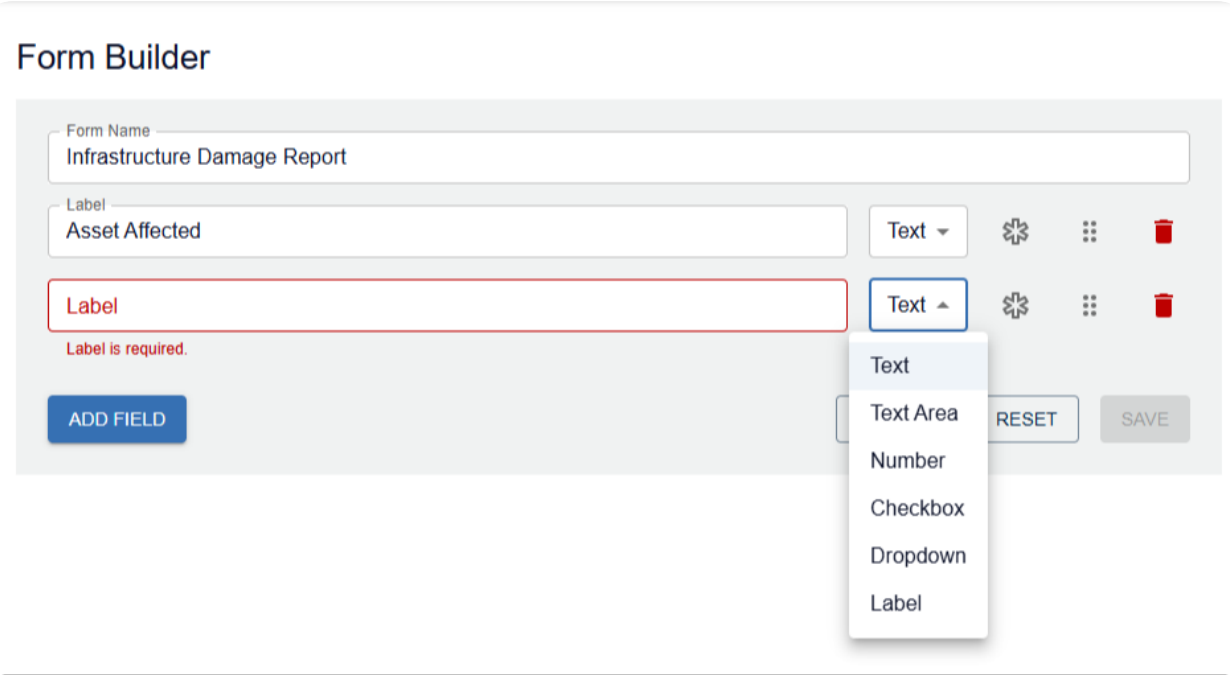
Enter a clear and descriptive name for the form. This name will appear in the drop-down menu when users select a form while creating a log entry.



09 Adding Form Fields

Click Add Field to begin building the form structure. Enter a label for the field and then choose the most appropriate input method for the data required.

- Use text entry for short, single line answers.
- Use text area for longer descriptive responses.
- Use number entry for numerical data only.
- Use checkbox for simple yes or no choices.
- Use drop down to allow users to select from a predefined list.
- Use label to insert instructional text or headings within the form.



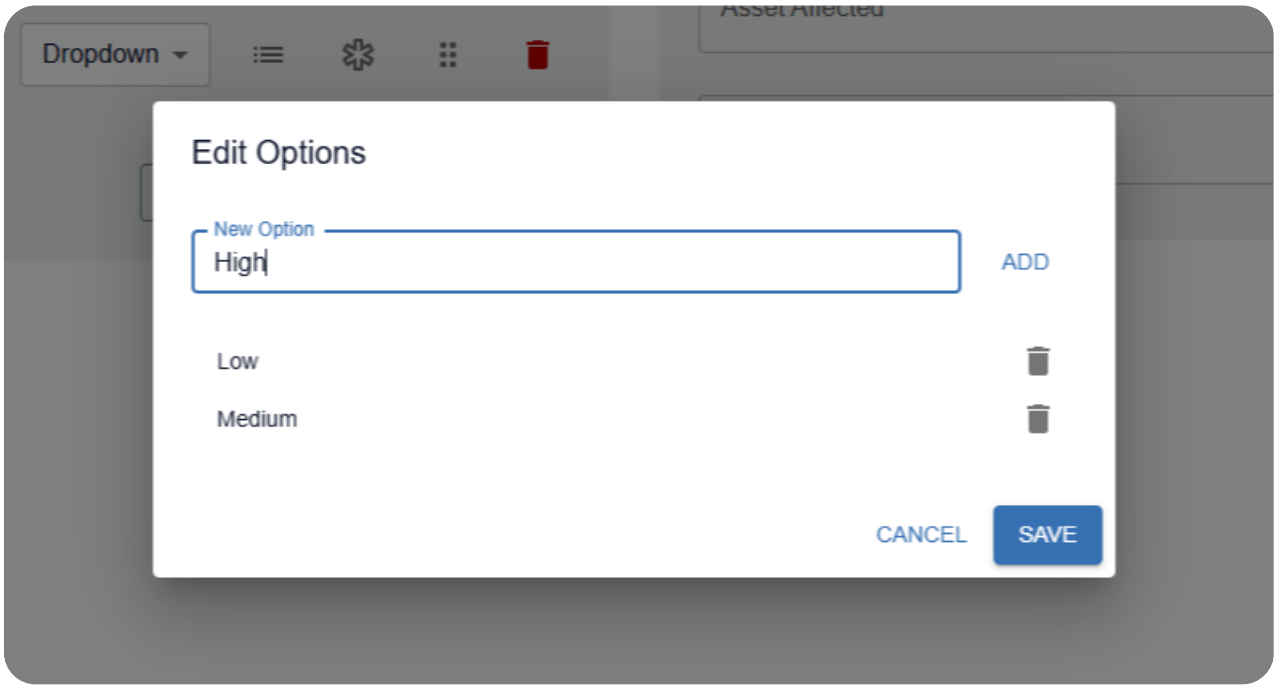
10 Managing Drop-Down Options

If using a drop-down field, click the list button to add options.

Type an option and click Add.

Repeat this process to include additional options.

Options can be removed using the bin icon.



11 Mandatory Fields, Preview, and Saving Custom Forms

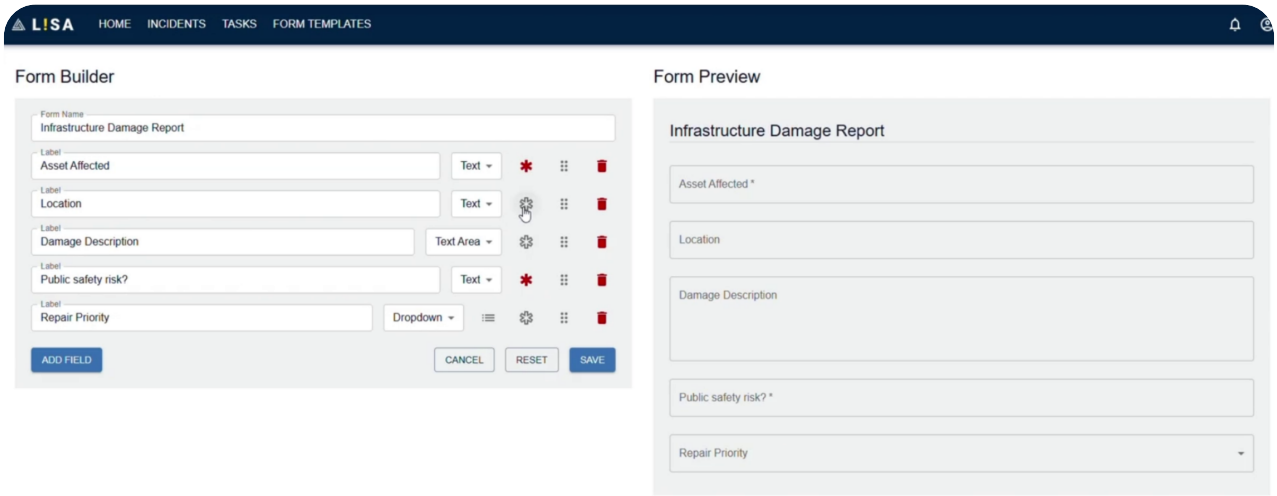
Essential fields can be marked as mandatory by selecting the asterisk icon next to the field. When the form is used, this indicator will appear in red to show that the field must be completed before saving.

Use the form preview panel on the right to interact with the form and check that the structure and flow are clear for responders.

Rearrange the order of a field by holding the six dots next to it and dragging it into position.

Delete a field using the red bin to the right of it.

When the form is complete, click Save to publish the template. The form will immediately become available to all Lisa users in the custom form menu within an incident log.



That completes the admin capabilities for the LISA demonstrator at present. For further information about LISA and the National Digital Twin Program, visit the National Digital Twin Program website at www.ndtp.co.uk.
