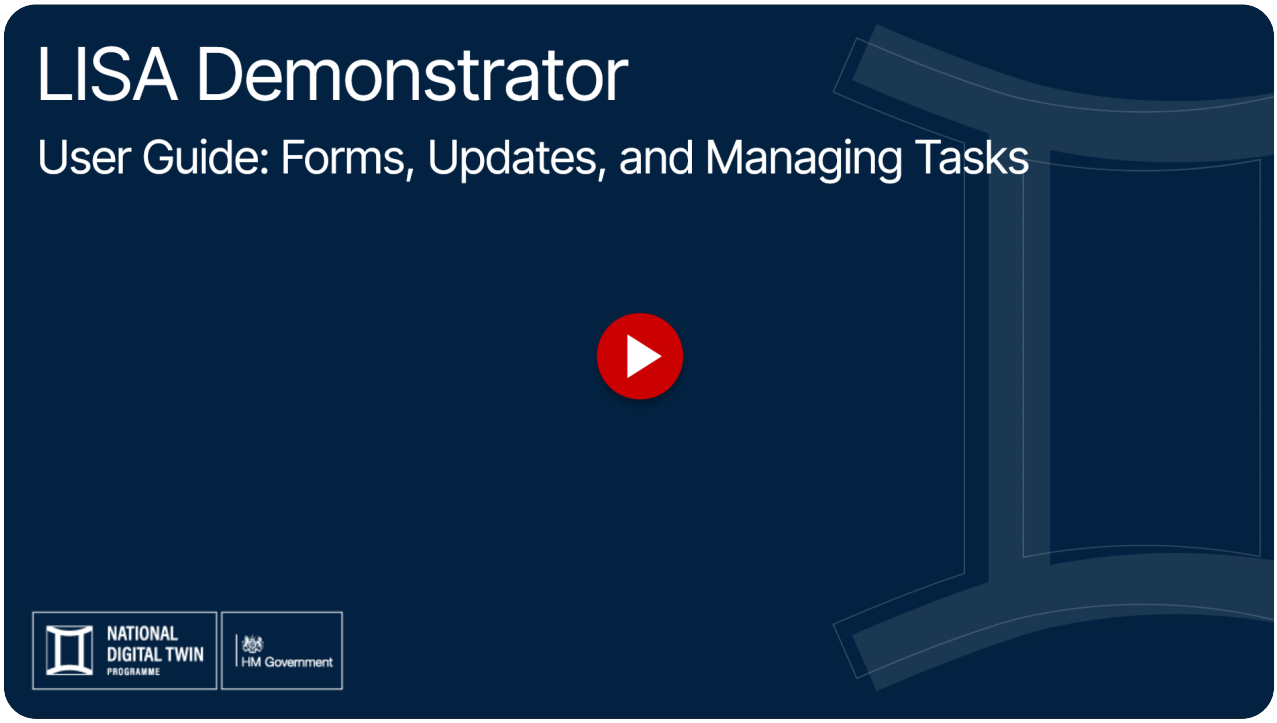
LISA - User Guide 2: Logging Incidents and Managing Tasks

Powered by guidde

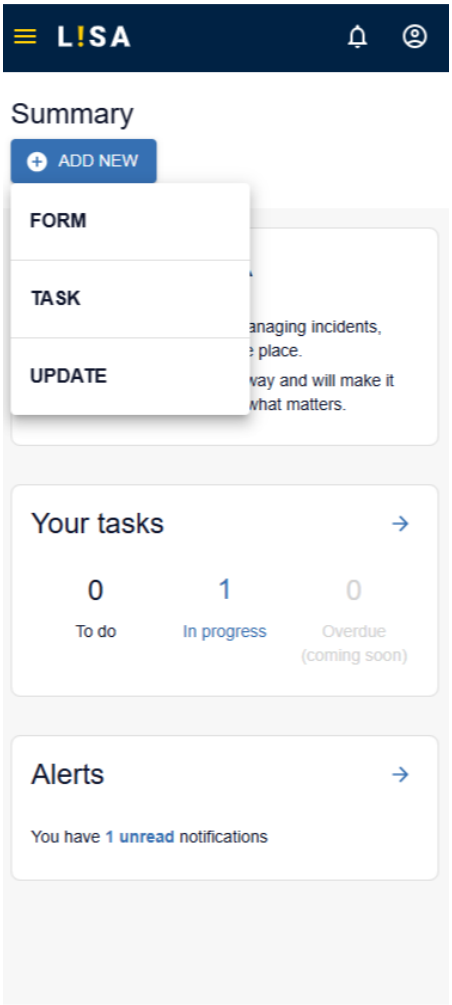


This guide will cover the various entry points for logging information on incidents in LISA. It will explain how to add forms, updates and tasks, as well as introduce the task management aspects of the LISA demonstrator.

01 LISA Data Entry Points

LISA allows you to record information from multiple locations so that data can be logged as soon as it becomes available.

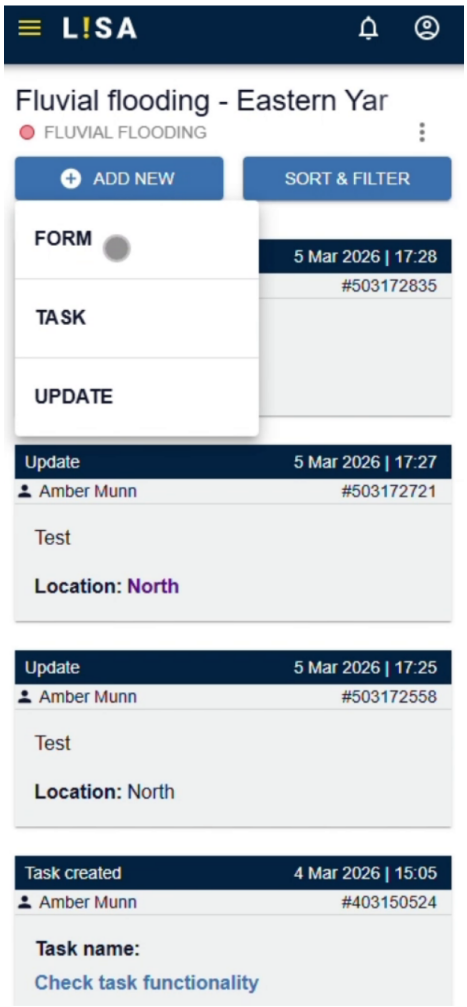
- The Add New button can be found on the home page or within a specific incident page. Use this button to add forms, updates, or tasks to an incident.
- When adding an entry from the home page or the tasks page, you must first select the relevant incident from the drop-down menu.
- If you are already inside a specific incident page, any new entry will automatically be linked to that incident log.



02 Form Standardised Data Capture

Forms ensure that critical data, such as situation reports or communications, is captured in a standardised format.

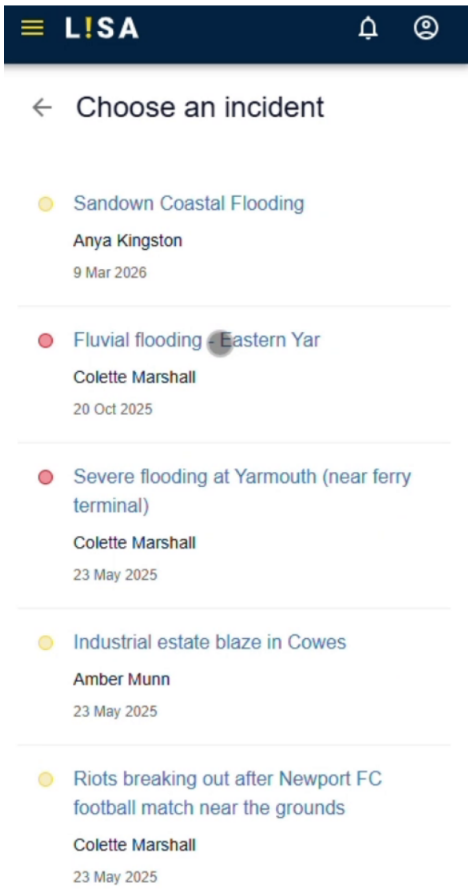
- To add a new form from the home page, click the Add New button and select Form.



03 Selecting Incident For Form

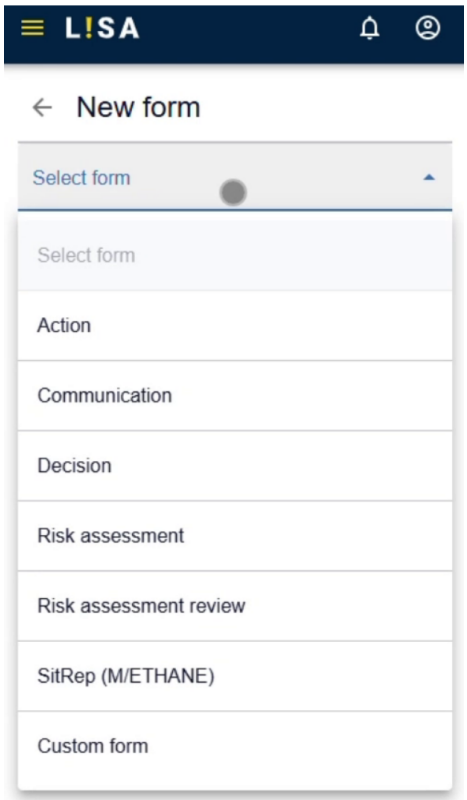
Choose the incident that the form relates to.

Alternatively, open the incident first from the Incidents page and then click the Add New button from within that incident.



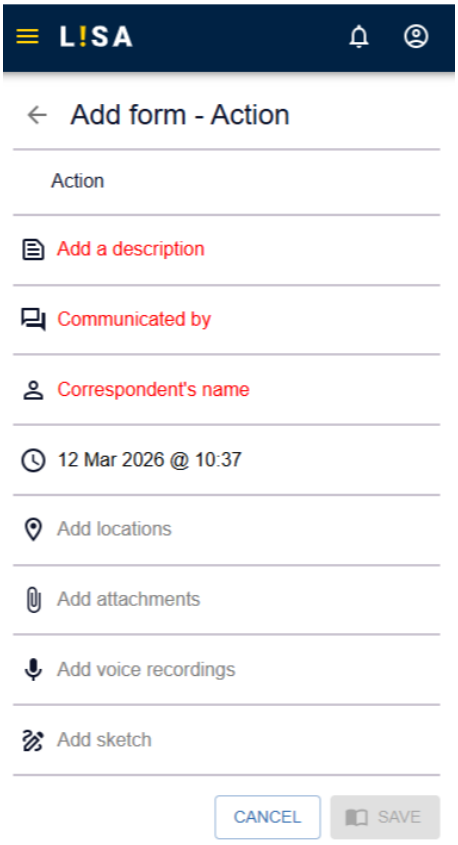
04 Choosing Form Templates

Open the Select Form drop-down menu to view the available templates. Choose a preset template from the list or select custom forms if you need to access a bespoke template created by an admin user.



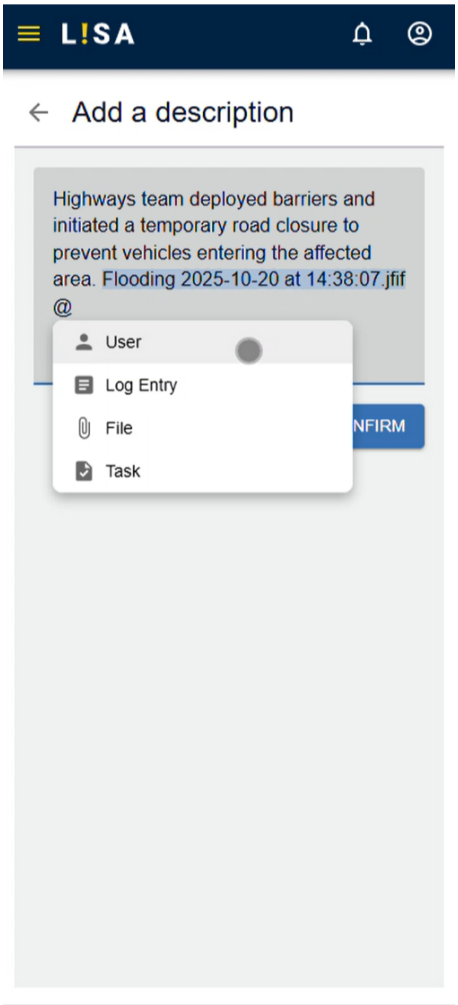
05 Completing Mandatory Fields

Complete the mandatory fields, which are highlighted in red.



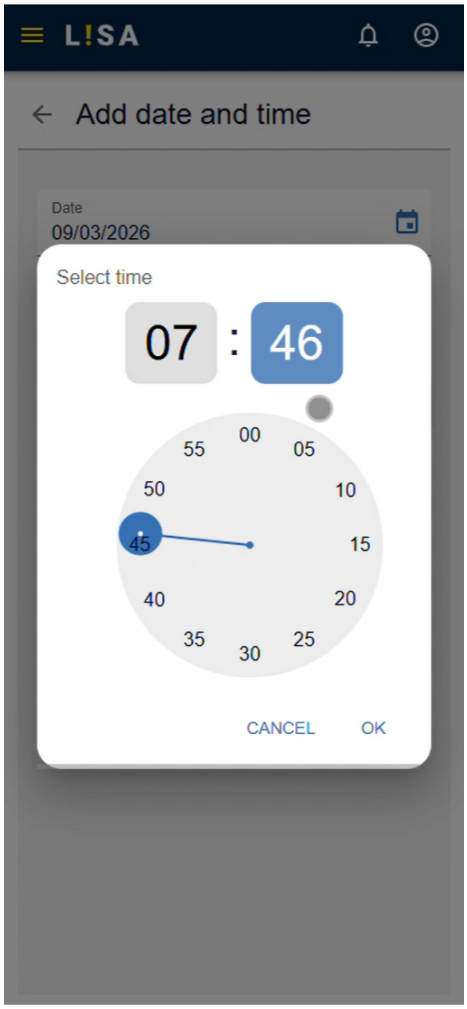
06 Mentioning Users, Log Entries, Files and Tasks

Use the @ symbol in any text field to mention users or cross reference other log entries, files or tasks in LISA.



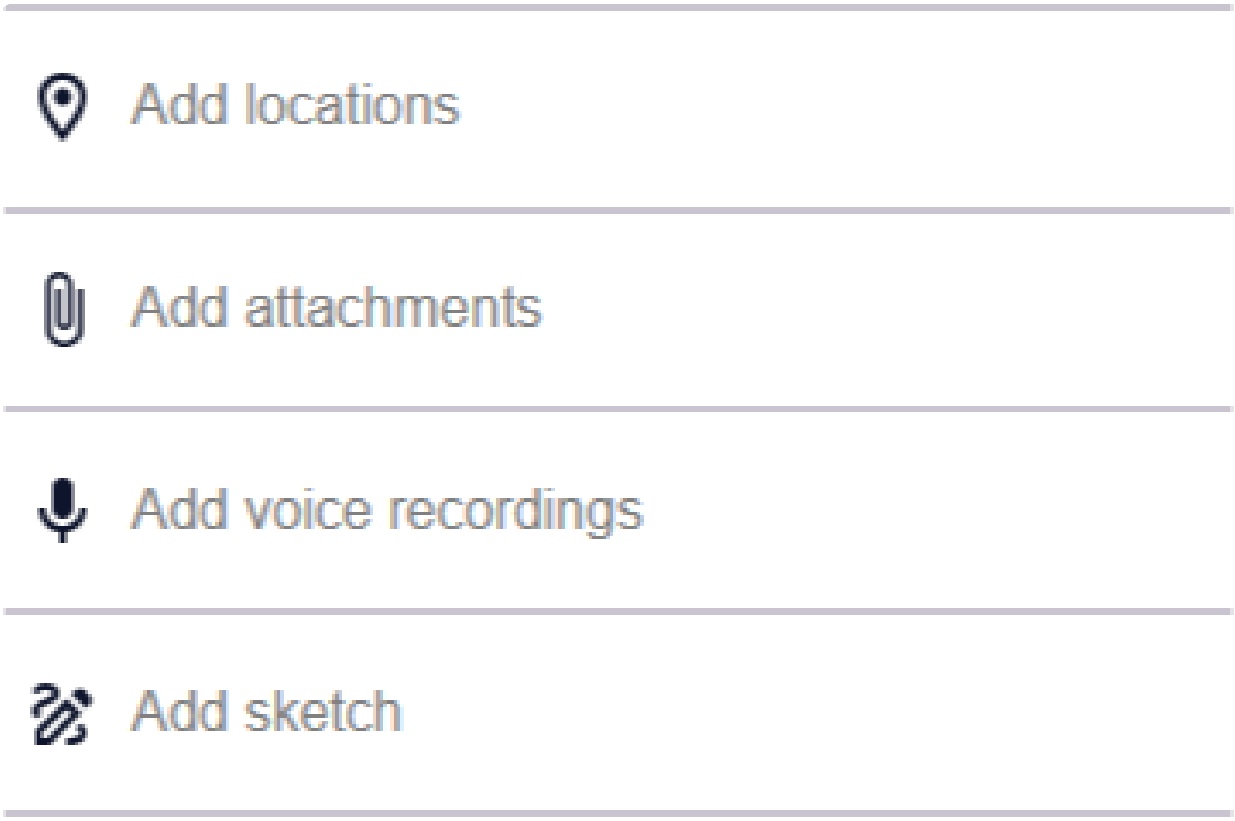
07 Adjusting Date And Time

You can adjust the date and time manually using the calendar and clock tools if the event occurred earlier. Otherwise, the system will default to the current time.



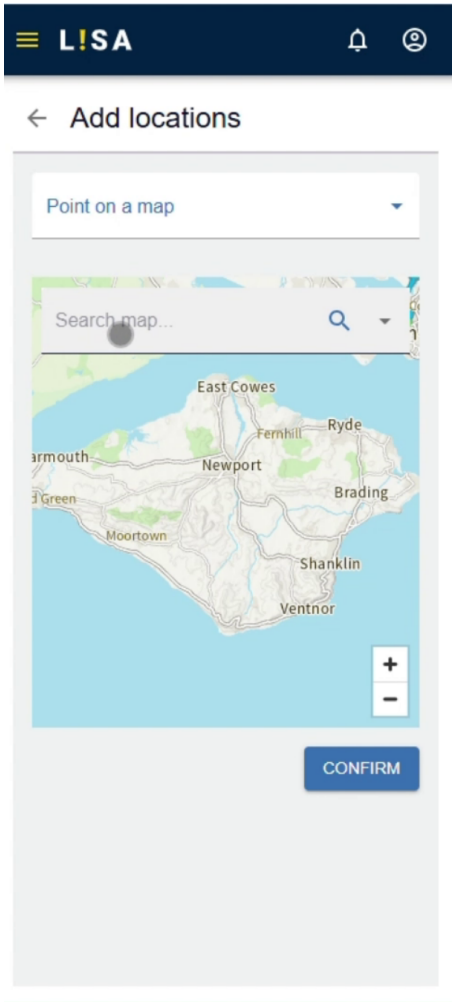
08 Adding Optional Context

Optional context can be added, including locations, voice recordings, attachments, or sketches, if the selected form template allows it.



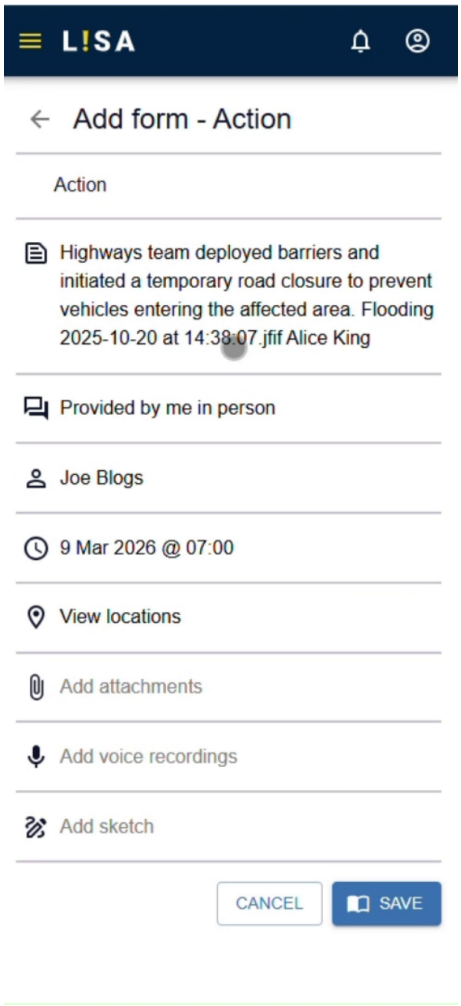
09 Linking Form To Map Location

The location field allows you to add a description, select a point on the map, or combine both. To link the form to a location on the map, search for an address, confirm that the map pin is positioned correctly, and then select Confirm.



10 Saving Form To Incident Log

Click Save to finalise the form and add it to the permanent, immutable incident log.

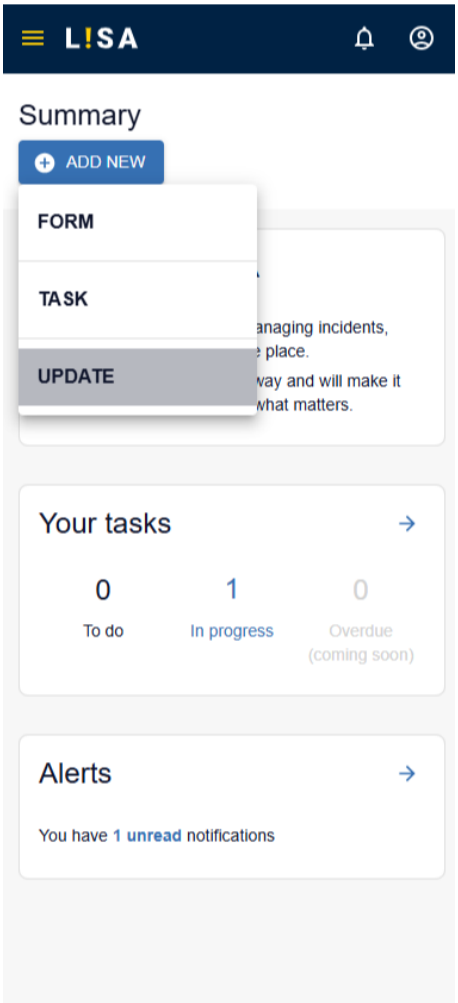


11 Updates As Free Text Entries

Another type of data entry in LISA are updates. Updates provide a way to add non-structured, free text information to the incident record.

12 Adding Update From Home Page

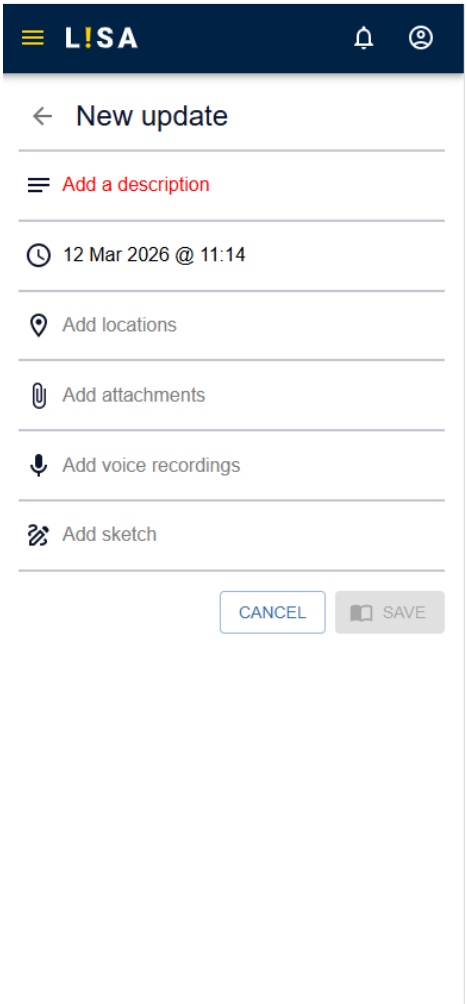
To add an update from the home page, select Update from the Add New menu. Select the incident that the update relates to.



13 Typing Update And Tagging

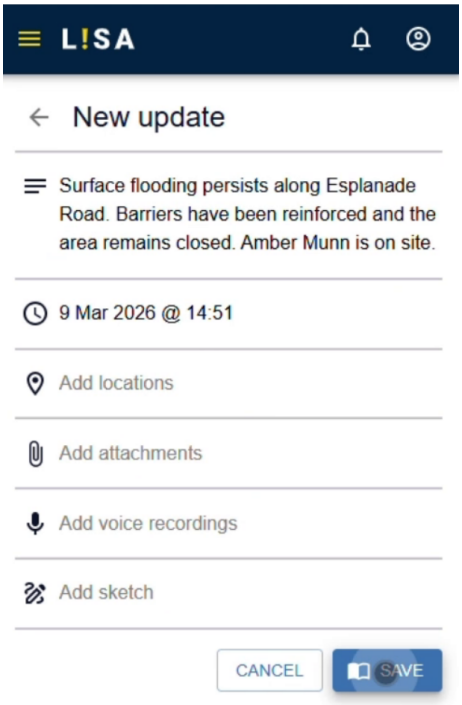
Type your report into the description field.

- Use the @ symbol to tag a specific person, log entry, task, or file already stored in the system to create a cross-reference.
- Further evidence can be included by selecting the optional icons for location, attachments, voice recordings, or sketches.



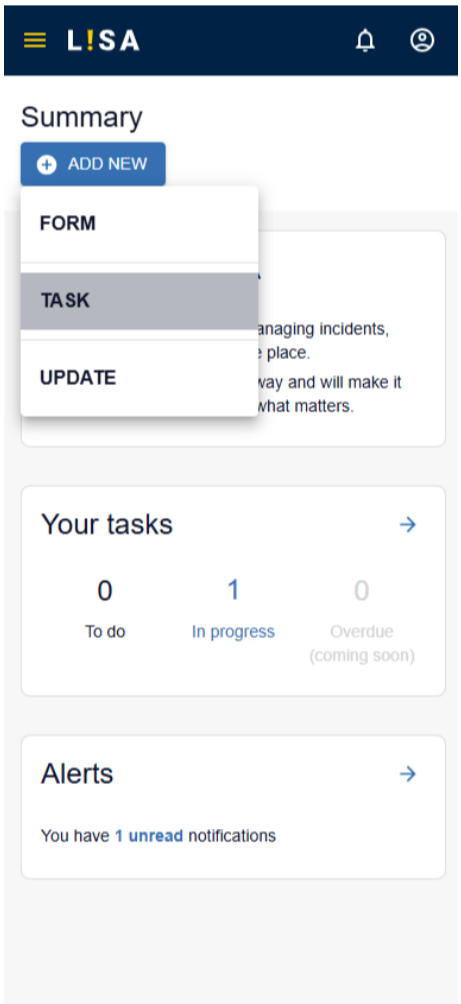
14 Saving Update To Log

Click Save to add the update to the chronological incident log.



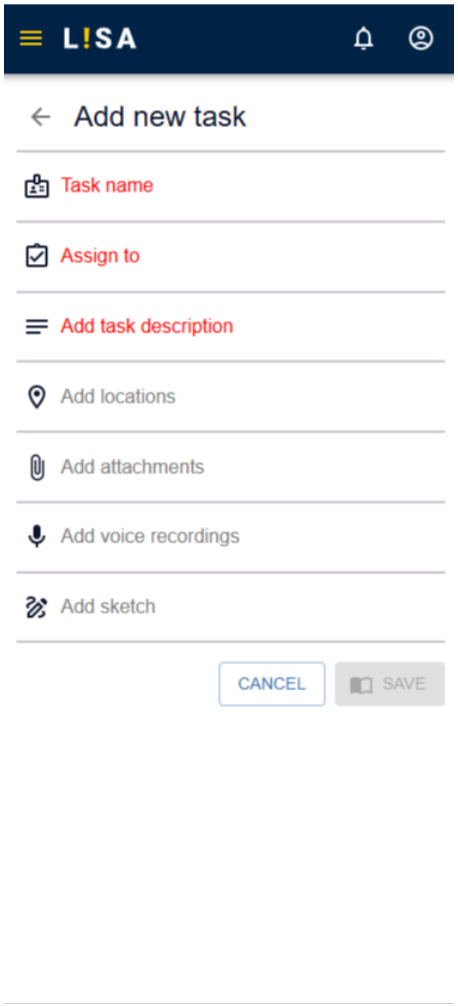
15 Creating Tasks From Home

LISA also allows users to create and assign tasks. To add a task from the home screen, click the Add New button and select Task from the menu. Tasks can also be added from a specific Incidents page, or from the Tasks page. Access these using the sidebar.



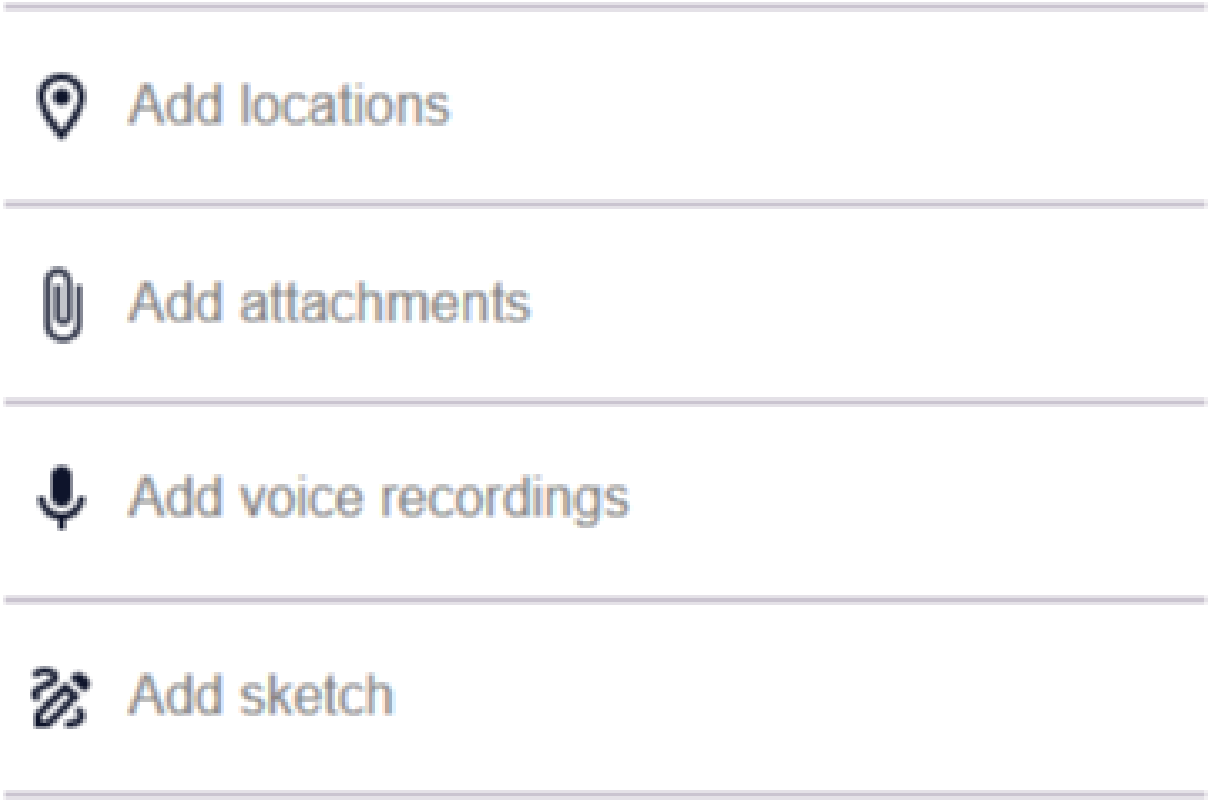
16 Entering Mandatory Task Fields

Complete the mandatory fields in red: the task name, the assignee, and the task description.



17 Adding Optional Task Context

Context can be included using the optional icons for location, attachments, voice recordings, or sketches.

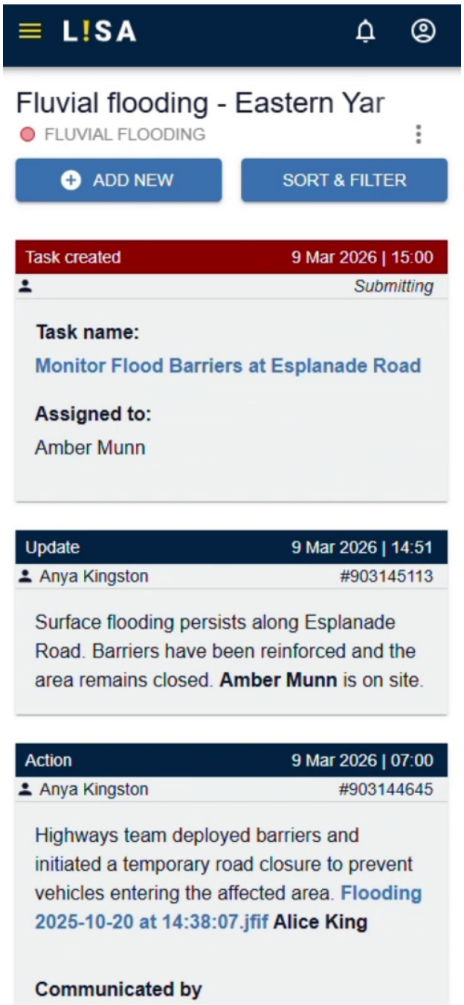


18 Saving Task And Initial Status

Click Save to create the task. The task will be created with an initial status of To Do.

19 Task Notification Confirmation

Confirm that the task has been added to the incident log and that the assignee has received a system notification.

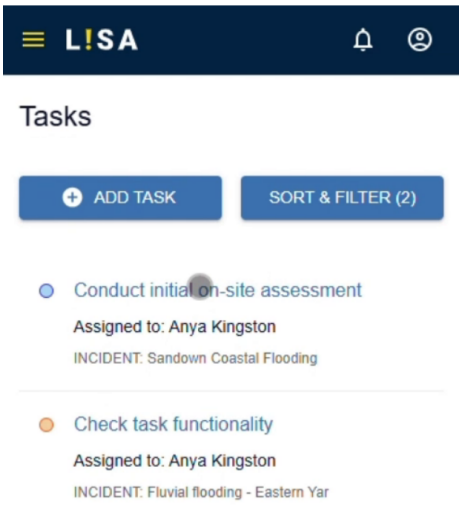


20 Task Management Features

The task management features of LISA allow users to update responsibilities and track task progress.

21 Viewing Assigned Tasks

Open a task from the tasks page or from the incident log to view its details. To view tasks assigned specifically to you, filter the tasks by assignee or open the Your Tasks card on the home screen and select the blue arrow. Select a task to open its details.

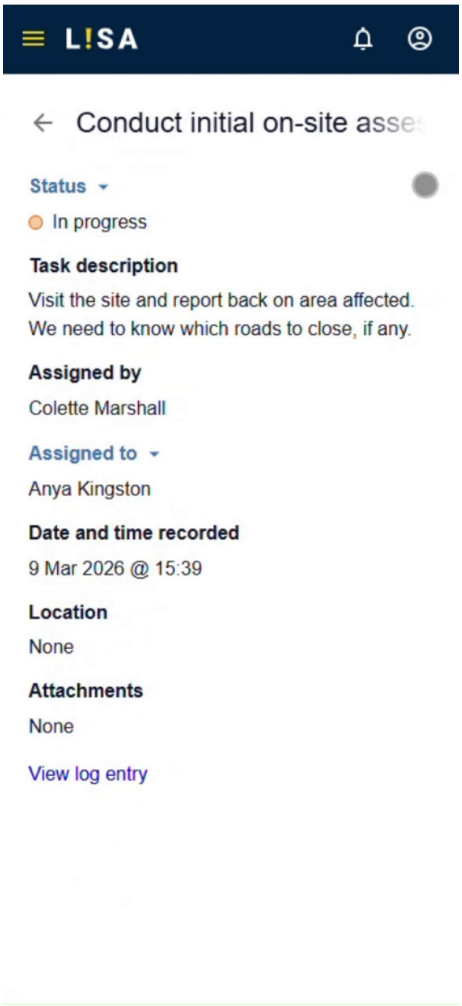


22 Updating Task Status And Assignee

Update the status of the task as work progresses, for example changing the status from To Do to In Progress or To Done.

You can change the assignee if the task needs to be handed over to another team member. This action can be performed by either the task creator or the current assignee. If you are the assignee and you reassign the task to another user, you will no longer have permission to change the assignee again.

Every change to a task's status or assignee automatically creates a new entry in the immutable incident log.



That completes how to log information and manage tasks using the LISA demonstrator. Refer to the other LISA user guides for a tour of navigating the app or to find out how to use admin controls.
